The work ships when the *invoice clears.*

Four AI agents quote a job, bill it through real PayPal invoices, chase the payment, and release the work only when PayPal says it's paid. A client's own AI assistant can hire the agency over MCP. A person approves every money move.

LIVE DEMO	CODE (MIT)	VIDEO, 2:13	DEVPOST

01 TRY IT IN TWO MINUTES · NO LOGIN

01 **Fill example**, any name and an `@example.com` email, **Get a quote**. The Scoper prices it under a hard cap.
02 **Approve · 50% deposit first**. Real PayPal sandbox invoices are created and sent; their ids show on the job.
03 **Send reminder now**. The Collector writes it; PayPal's remind API sends it.
04 **Demo: pay deposit**, then watch the watermarked preview appear. **Demo: pay balance** unlocks **Download**.
05 **Try a prompt injection**. Hidden instructions are listed, struck through and ignored.
06 **Ledger** tab (AG Grid), **AI agents** tab (MCP URL), then **Refund**.

02 THE LOOP

01 **Scoper** (Gemini, structured output): request → fixed-price quote, capped in code, plus a list of injected instructions it ignored.
02 **A person approves**: in full, or a 50% deposit first. Nothing reaches PayPal before this.
03 **Biller** (tool calling): one forced call drafts the invoice; the code sends it.
04 **Collector**: reminders on a schedule, at most three, through PayPal.
05 **Builder**: starts when PayPal reports payment. Deposit → watermarked preview; balance → final files.
06 Until then the work answers **HTTP 402 Payment Required** with a machine-readable PayPal pay link.

03 PAYPAL · 10 ENDPOINTS, HAND-WRITTEN REST

- **Invoicing v2**: create, send, get, remind, cancel, record payment, record refund.
- **Payments v2**: refund a capture. **Webhooks**: signature verification. **OAuth 2.0**.
- Deposit plans use partial payments, or a deposit invoice plus a balance invoice where the merchant's country doesn't allow them (ours didn't).
- The job id is the `PayPal-Request-Id`, so retries never double-invoice.

04 AI AND AGENTIC COMMERCE

- **Gemini** via the Vercel AI SDK: `gemini-flash-latest` → `flash-lite-latest` → `3.8-flash`, with timeouts and a rest period for busy models.
- **MCP server** (official TypeScript SDK): `request_quote`, `get_job`, `list_jobs`. A buyer's AI can ask and track; it has no tool to approve, pay, cancel or refund.
- Failed builds retry on their own, up to five times.

05 SAFETY BY DESIGN

- Amounts and recipient come from the **approved quote in server state**, never from model output (CaMeL, arXiv 2503.18813).
- Untrusted text can't trigger consequential actions (arXiv 2506.08837).
- Refund and cancel have **no AI tool**. Webhooks only trigger a fresh read from PayPal.
- Builder HTML runs in a sandboxed iframe under a strict CSP.

06 SPONSOR TOOLS · VERIFIED

- **AG Grid**: the receivables desk. Quick views, aging buckets, pinned totals that follow filters, bulk **Remind selected**, CSV export, themed.
- **Render**: one-click Blueprint (`render.yaml`), auto-deploy from `main`, health check.
- **10 of 10** tests pass (`npm test`). Whole flow run on the live sandbox, Nov 12, 2026.

The AI proposes. The code enforces. *People approve.*

Agents do the work around the money: scoping, writing, chasing, building. The money itself belongs to code and people.
